

Prime Palindrome – UML Diagram & Algorithm

1. UML Class Diagram

2. Algorithm

Step 1: Start.

Step 2: Read the number **n** from the user.

Step 3: Check whether **n** is prime. If $n < 2$, it is not prime. Otherwise, check divisibility from 2 to $n/2$.

Step 4: Check whether **n** is a palindrome. Store the original number, reverse its digits, and compare the reversed number with the original.

Step 5: If the number is both prime and palindrome, display “**Prime Palindrome**”.

Step 6: Otherwise, display “**Not a Prime Palindrome**”.

Step 7: Stop.

3. Simple Flow of Logic

START	↓
Read n	↓
Is n Prime?	No → Not Prime Palindrome
Yes	↓
Is n Palindrome?	No → Not Prime Palindrome
Yes	↓

Prime Palindrome	↓
STOP	

Example: 131 → Prime ✓ and Palindrome ✓ → Prime Palindrome
